1.EXECUTIVE SUMMARY

1.1 Project Overview

The School Management System is a comprehensive digital platform designed to modernize and streamline educational institution management. This web-based application serves as a centralized hub that connects school administrators, teachers, students, and parents in a seamless digital ecosystem.

The system transforms traditional paper-based school operations into an efficient, automated workflow that enhances communication, improves data management, and provides real-time insights into academic performance and school operations. Built with user experience as the primary focus, the platform offers role-specific dashboards and intuitive interfaces that cater to the unique needs of each user group. It is designed to replace traditional manual processes with a simple, guided workflow that makes school management faster, more transparent, and easier to use.

The solution encompasses 15+ integrated modules covering all aspects of school management, from student admissions to financial reporting, creating a complete digital transformation of educational administration processes.

1.2 Objectives and Goals

Primary Objectives:

1. Digital Transformation: Replace manual, paper-based processes with automated digital workflows.
2. Enhanced Communication: Create seamless communication channels between all stakeholders.
3. Data-Driven Decision Making: Provide comprehensive analytics and reporting capabilities.
4. Improved Efficiency: Reduce administrative workload and eliminate redundant tasks.
5. Accessibility: Ensure all users can access information anytime, anywhere.

Specific Goals:

1. Achieve 80% reduction in paperwork and manual data entry.
2. Enable real-time communication between teachers and parents.
3. Provide instant access to student performance data.

4. Automate fee collection and financial reporting processes.
5. Create a scalable platform that can grow with the institution.
6. Ensure 99.9% system uptime for critical school operations.

1.3 Key Benefits

For Educational Institutions:

- **Operational Efficiency:** Streamlined administrative processes reduce workload by 85%
- **Cost Savings:** Significant reduction in paper, printing, and storage costs.
- **Real-time Insights:** Instant access to comprehensive school performance data.
- **Improved Communication:** Direct, instant communication between all stakeholders.
- **Scalability:** Platform grows seamlessly with increasing student numbers.

For Teachers:

- **Time Savings:** Automated attendance and report generation
- **Better Organization:** Centralized access to all teaching materials and student data
- **Enhanced Communication:** Direct parent interaction capabilities
- **Performance Tracking:** Clear visibility into student progress and class performance
- **Work-Life Balance:** Reduced after-hours administrative work

For Parents:

- **Transparency:** Complete visibility into child's academic progress and attendance
- **Convenience:** Access to all school information from mobile devices
- **Timely Updates:** Instant notifications about important school events and deadlines
- **Financial Clarity:** Clear fee structures and payment tracking
- **Peace of Mind:** Assurance that child's education is being monitored effectively

For Students:

- **Personal Access:** Ability to view their own academic records and progress
- **Clear Expectations:** Easy access to homework assignments and exam schedules
- **Self-Service:** Online access to personal information and documents
- **Digital Skills:** Development of technology literacy alongside academic learning

1.4 Scope of the System

Core Functional Areas:

1. **Academic Management:** Complete curriculum planning, syllabus management, and academic year configuration.
2. **Student Lifecycle Management:** From admission to graduation, including transfers and promotions.
3. **Teacher Administration:** Staff management, subject assignments, and workload tracking.
4. **Attendance Systems:** Daily attendance marking with automated reporting and notifications.
5. **Examination Management:** Complete exam lifecycle from scheduling to result publication.
6. **Financial Management:** Fee structure setup, online payments, and comprehensive financial reporting.
7. **Communication Hub:** Announcements, messaging, and notification systems.
8. **Reporting & Analytics:** 20+ report types with export capabilities.

User Categories:

- **Super Administrators:** Multi-tenant management and system-wide oversight
- **School Administrators:** Institution-level management and configuration
- **Teaching Staff:** Classroom management and student assessment
- **Students:** Personal academic data access
- **Parents/Guardians:** Child progress monitoring and communication
- **Support Staff:** Specialized roles (librarians, transport coordinators, etc.)

Technical Scope:

- **Web-Based Platform:** Accessible from any device with internet connectivity
- **Progressive Web App:** Installable application in desktop and mobile.
- **Mobile Responsive:** Optimized for smartphones and tablets
- **Multi-Browser Support:** Compatible with all modern web browsers
- **Real-Time Updates:** Instant data synchronization across all users
- **Data Export:** Multiple format support (PDF, Excel, CSV)

2. INTRODUCTION

2.1 Purpose of the Document

This document is created to explain the School Management System in a clear, end-user perspective way. It helps readers understand what the system does, who uses it, and how it supports school operations. The goal is to provide a guide for stakeholders, decision-makers, and users who need to know the system's purpose, capabilities, and structure.

2.2 System Overview

The School Management System is a web-based application designed to manage core school processes in one place. It brings together:

- student admissions and profiles,
- Academic Management
- attendance tracking,
- exam management,
- fee payments,
- communication between teachers and parents,
- transport and hostel services,
- reporting and analytics.

The system acts as a digital school office that reduces manual paperwork, improves communication, and gives real-time visibility into school activities.

2.3 Target Audience

This document is intended for:

- **School Administrators** who manage school operations and configure the system
- **Teachers** who use the system for attendance, exams, homework, and communication
- **Parents** who monitor their child's progress, attendance, and fee status
- **Students** who view their own academic details and school updates
- **Support Staff** such as accountants, librarians, and transport coordinators
- **Project Stakeholders** and non-technical decision-makers who need an overall understanding of the system

3. USER ROLES AND RESPONSIBILITIES

3.1 Role Management

Role management is the feature that defines who can access what in the School Management System. It allows the school to control access, protect sensitive data, and assign responsibility clearly across the organization.

What Role Management Does:

1. Creates roles dynamically: You can add any number of roles, such as “Admin,” “Teacher,” “Parent,” “Student,” “Accountant,” “Librarian,” “Bus Supervisor,” etc.
2. Controls permissions: Each role is assigned specific permissions that decide which modules, pages, and actions are available.
3. Determines workflow: A user’s role decides what tasks they can perform, what information they can view, and what menu options they see.
4. Keeps the system secure: By limiting access, the system ensures only authorized users can perform sensitive operations.

Key Components of Role Management

1. Role Creation

1. Define a new role name.
2. Choose the modules or features this role can access.
3. Example: Create a role called “Library Manager” and grant access to library, book inventory, and issue/return functions.

2. Permission Assignment

1. Assign granular actions like “view only,” “create,” “edit,” or “delete.”
2. Permissions can be specific to functional areas such as attendance, fees, exams, reports, and communications.
3. Example: A “Teacher” role may have permission to mark attendance, enter marks, and view class reports, but not change school settings.

3. Role Assignment

1. Attach users to roles.
2. Each user inherits the permissions of their assigned role.
3. Users can be assigned one or multiple roles depending on the system design.

4.Role Editing

1. Update role permissions as requirements change.
2. Add or remove access to modules without changing the user accounts.
3. Example: Expand “Parent” role to also allow access to a new “Bus Tracker” feature.

4. Role Deletion or Deactivation

Why Role Management Matters

- **Flexibility:** Schools can model their actual structure in the software, not the other way around.
- **Scalability:** As the school grows, new roles can be added without rebuilding the system.
- **Clarity:** Everyone knows their responsibilities because roles map directly to tasks.
- **Security:** Sensitive operations are restricted to only the right people.
- **Consistency:** Users in the same position see the same interface and access the same functions.

3.2 Super Administrator

The Super Administrator is the highest-level user in the system. This role oversees the entire platform and manages multiple schools, system settings, and global access.

Responsibilities:

- Create, activate, or deactivate school tenants.
- Define new roles and permissions for the system.
- Create and manage users across all schools.
- Configure global settings and system-wide policies.
- Monitor audit trails and system logs.
- Approve or review major administrative changes.
- Control access to sensitive data and top-level functions.

Key capabilities:

- Full access to all modules and reports
- Ability to manage multi-tenant structure
- Complete control over user roles and permissions
- System-level reporting and analytics

3.2 School Administrator

The School Administrator manages a single school's operations. This role is responsible for daily school management, academic setup, and administrative tasks.

Responsibilities:

- Set up classes, sections, and subjects
- Manage student admissions and enrollments
- Assign teachers to classes and subjects
- Create academic calendars and timetables
- Configure school-specific fee structures
- Oversee attendance, exams, and reports
- Manage school settings and policies
- Review performance and generate school reports

Key capabilities:

- Access to school-level administration modules
- Control over academic and financial settings
- Permission to manage teacher and student data
- Ability to view and publish school reports

3.3 Teachers

Teachers are the main academic users of the system. They handle classroom activities, student progress, and communication with parents.

Responsibilities:

- Mark daily attendance for their classes
- Create and assign homework or assignments
- Schedule exams and enter student marks
- Track student progress and performance
- View class and student reports
- Communicate with parents and administrators
- Share announcements with students and parents
- Help manage timetable-related activities

Key capabilities:

- Access to class management and academic modules
- Ability to record marks, attendance, and homework

- Permission to view student profiles and performance
- Tools for direct communication with parents

3.4 Students

Students use the system to access their own academic information and stay informed about school tasks.

Responsibilities:

- View attendance records and class schedule
- Check homework and exam details
- Review exam results and report cards
- Monitor academic progress
- Access notices and school announcements
- Use the system as their personal academic dashboard

Key capabilities:

- Personal access to academic performance data
- View-only access to relevant student information
- Ability to see assigned homework and upcoming events
- Access to grade reports and attendance summaries

3.5 Parents / Guardians

Parents and guardians use the system to monitor their child's school life and stay connected with teachers.

Responsibilities:

- View child attendance and academic progress
- Track fee status and payment history
- Receive announcements and important notifications
- Communicate with teachers about student performance
- Review exam results and report cards
- Stay informed about school events and activities

Key capabilities:

- Access to child-specific dashboards

- Permission to view attendance, marks, fees, and notices
- Communication tools to contact teachers/admin
- Ability to monitor multiple children if needed

3.6 Support Staff

Support staff are users who handle operational functions in the school. Their access is limited to the modules they need to perform their job.

Typical roles include:

- Librarian
- Accountant
- Transport Coordinator
- Hostel Warden
- Receptionist
- Lab Assistant

Responsibilities:

- Manage specific operational areas like library, transport, or hostel
- Track inventory, issue books, and record returns
- Manage transport routes, vehicles, and student allocation
- Record hostel room assignments and student check-ins
- Assist with fee collection and financial records
- Support administrative tasks and data entry

Key capabilities:

- Access only to assigned modules
- Permission to perform operational tasks
- Limited view of student or staff data based on role
- Ability to update and manage records relevant to their area

4. SYSTEM ADMINISTRATION

The System Administration module with nested submodules. It is visible only to superadmin users and provides comprehensive platform-wide management capabilities across all tenant schools in the multi-tenant architecture. This also includes system monitoring, backup management, platform configuration, and cross-tenant analytics to ensure optimal performance and security across the entire ecosystem.

4.1 System Dashboard

Serves as the central command center for platform oversight, displaying real-time metrics and analytics across all tenant schools. Key features include total active tenants, system uptime statistics, recent tenant registrations, subscription revenue tracking, and platform-wide usage patterns. It provides alerts for system issues, pending tenant approvals, and subscription expirations. This submodule enables super administrators to monitor the overall health and performance of the entire platform ecosystem.

- Total active tenants count and status overview
- System uptime statistics and performance metrics
- Recent tenant registrations and onboarding tracking
- Subscription revenue tracking and billing analytics
- Platform-wide usage patterns and resource utilization
- Real-time alerts for system issues and critical events
- Pending tenant approvals and review queue management
- Subscription expirations and renewal notifications

4.2 Manage Tenants

Handles the complete lifecycle management of individual school tenants within the platform. Form fields include school name, unique school code, domain configuration, contact information (email, phone, address), subscription plan selection, activation status, and tenant-specific settings. Functionality covers tenant creation with automated database provisioning, configuration of school-specific parameters, subscription management with billing cycles, tenant suspension/reactivation controls, and data export capabilities for tenant migration. This submodule ensures proper isolation and resource allocation for each school while maintaining platform-wide consistency.

- School name and unique school code assignment
- Domain configuration and URL mapping
- Contact information management (email, phone, address)
- Subscription plan selection and billing configuration
- Activation status controls and tenant lifecycle management
- Automated database provisioning during tenant creation
- School-specific parameter configuration and customization

- Subscription management with automated billing cycles
- Tenant suspension/reactivation controls for compliance
- Data export capabilities for tenant migration and backups

4.3 Manage Users

Controls the creation and management of super administrator accounts and global user permissions that transcend individual tenant boundaries. Form fields typically include username, email address, full name, role assignment (superadmin, platform support), account status, password policies, and multi-factor authentication settings. Advanced features include audit logging of all administrative actions, permission inheritance controls, and emergency access protocols. This submodule maintains the highest level of access control for platform-level operations while providing granular permission management.

- Username and email address registration
- Full name and profile information management
- Role assignment (superadmin, platform support, etc.)
- Account status controls (active, suspended, pending)
- Password policies and security requirements
- Multi-factor authentication settings and enforcement
- Audit logging of all administrative actions
- Permission inheritance controls and role hierarchies
- Emergency access protocols and temporary elevations

4.4 Roles & Permissions

Establishes and manages the hierarchical role-based access control (RBAC) system across the entire platform. Form fields include role name, detailed description, permission checkboxes organized by functional areas (tenant management, user administration, system monitoring, billing), inheritance rules for role hierarchies, and scope limitations (platform-wide vs. tenant-specific). The system supports custom role creation, permission templates, and audit trails for permission changes. This submodule ensures secure access control while allowing flexible permission assignment for different administrative responsibilities.

- Role name and detailed description management
- Permission checkboxes organized by functional areas
- Inheritance rules for role hierarchies and cascading permissions
- Scope limitations (platform-wide vs. tenant-specific access)
- Custom role creation and template management
- Permission templates for common administrative roles
- Audit trails for permission changes and access history
- Bulk permission assignment and role synchronization

4. FUNCTIONAL MODULES

4.1 Modules

A module is a high-level functional domain that groups related capabilities within the application. Modules are not just menu items; they represent the main areas of responsibility in the School Management System. The Modules section defines the core functional building blocks of the platform, where each module represents a logical group of features in the sidebar navigation.

Grouping features into modules helps organize the system into manageable domains aligned with real-world school operations. For example, academic-related features are grouped under modules like Academics and Exams, while operational features such as Transport and Hostel are maintained separately. This modular structure improves navigation, maintainability, and scalability by allowing new features to be added without affecting the overall system structure.

The relationship between modules and user roles is a key part of the system's access control mechanism. Modules are displayed based on the logged-in user's role, ensuring users only see the modules and submodules they are authorized to access. Some modules, such as System Admin, are restricted to superadmin users, while others like Attendance are accessible to admin and teacher roles.

The sidebar navigation enforces role-based access using the roles array defined in the menuItems configuration. In the Sidebar.jsx component, the filteredMenuItems array checks whether the user's normalized role matches the allowed roles for a module or its child items, including support for roles like demoadmin that inherit admin permissions.

This approach provides a personalized and secure interface where users access only the features relevant to their responsibilities. It reduces information overload, improves usability, and follows the principle of least privilege by limiting access to only the required functionalities.

4.2 Dashboard

The Dashboard module serves as the primary landing page for users upon logging into the School Management System, providing a centralized overview of key metrics, quick actions, and personalized insights. It is accessible to admin and demo admin roles, offering a high-level snapshot of school operations to help administrators make informed decisions at a glance. This module aggregates data from various parts of the system, presenting it in an intuitive, visual format to reduce the need for deep navigation.

Overview Widgets: This submodule displays essential statistics such as total students, teachers, classes, and current attendance rates. It includes interactive charts and graphs showing trends over time, like enrollment growth or fee collection progress. Functionality allows users to drilldown into specific metrics for more detailed views, with real-time updates to ensure data accuracy.

Quick Actions Panel: This submodule provides shortcuts to frequently used features, such as adding a new student, marking attendance, or generating a report. It includes customizable buttons and links that adapt based on user permissions, streamlining common tasks and improving productivity.

Recent Activities Feed: This submodule shows a timeline of recent system activities, including new admissions, exam results published, or announcements made. It supports filtering by date or category, with notifications for urgent items like pending approvals or overdue fees.

Alerts and Notifications: This submodule highlights important alerts, such as low attendance warnings, upcoming exam schedules, or system maintenance notices. It integrates with the messaging system to display unread messages and provides direct links to resolve issues.

Performance Metrics: This submodule presents key performance indicators, such as student pass rates, teacher workload distribution, and financial summaries. It uses visual elements like progress bars and heatmaps to make data easy to interpret, with export options for further analysis.

4.3 Master

The Master module serves as the foundational configuration hub for the School Management System, enabling administrators to set up and maintain core school data that other modules depend on. It is accessible to admin and staff roles, ensuring that only authorized personnel can modify these critical settings. This module ensures data consistency and provides the building blocks for academic operations.

1. **School Details** (/master/school-details): This submodule allows administrators to configure basic school information, including the school's name, address, contact details, logo, and other institutional metadata. It supports uploading and managing the school's branding elements, such as logos and banners, which are displayed throughout the system. Functionality includes editing school policies, setting up school codes, and defining operational parameters that affect the entire platform.'
2. **Academic Year** (/master/academic-years): This submodule manages the definition and lifecycle of academic years, allowing schools to create, edit, and archive academic periods. It includes setting start and end dates, defining terms or semesters within the year, and configuring year-specific settings like holidays and working days. This ensures that all academic activities are aligned with the correct timeframes, and it supports historical data retention for reporting purposes.
3. **Classes** (/master/classes): Focused on class management, this submodule enables the creation and organization of class structures, including grade levels, class names, and capacities. Administrators can define class hierarchies, assign subjects to classes, and

set class-specific rules. It integrates with student enrollment and teacher assignment, providing a centralized view of class compositions and facilitating bulk operations like class transfers or promotions.

4. **Sections** (/master/divisions): This submodule handles the subdivision of classes into sections or divisions, such as A, B, C for a grade level. It allows for the creation of section-specific details, including capacity limits, section leaders, and resource allocations. Functionality includes assigning students to sections, managing section timetables, and tracking section performance metrics, which helps in balancing class sizes and optimizing resource distribution.
5. **Subjects** (/master/subjects): Dedicated to subject catalog management, this submodule lets administrators define subjects offered by the school, including subject names, codes, descriptions, and categories (e.g., core, elective). It supports subject grouping, prerequisite definitions, and integration with curriculum planning. This ensures that subjects are consistently referenced across exams, timetables, and student records.
6. **Staff** (/teachers): This submodule provides a comprehensive interface for managing teaching and support staff profiles. It includes adding, editing, and viewing staff details such as personal information, qualifications, employment history, and contact details. Functionality covers role assignments, department affiliations, and performance tracking, serving as a central repository for staff data that feeds into payroll, attendance, and assignment modules.
7. **Subject Staff** (/master/subject-staff): This submodule facilitates the assignment of staff members to specific subjects, creating a mapping between teachers and the subjects they are qualified or assigned to teach. It supports multiple assignments per staff member, tracks teaching loads, and integrates with timetable generation. This ensures that subject expertise is properly allocated and monitored.
8. **Syllabus** (/master/syllabus): Focused on curriculum management, this submodule allows administrators to define and manage syllabi for each subject and class. It includes uploading syllabus documents, outlining learning objectives, topics, and assessment criteria. Functionality supports version control, approval workflows, and integration with homework and exam modules, ensuring that educational standards are maintained and accessible.

4.2.2 Academics

The Academics module handles the operational aspects of academic administration, including admissions, scheduling, and student progression. It is primarily accessible to admin roles, with some submodules extended to teacher and staff for collaborative workflows. This module streamlines academic processes and ensures smooth transitions through the student lifecycle.

- **Admission** (/academics/admission): This submodule manages the student admission process, from application intake to enrollment. It includes online application forms,

document uploads, eligibility checks, and approval workflows. Functionality covers fee payment integration, admission quotas, and generating admission letters, providing a streamlined path from inquiry to enrollment.

- **Holidays** (/academics/holidays): This submodule allows administrators, teachers, and staff to define and manage school holidays and non-working days. It includes creating holiday calendars, categorizing holidays (e.g., national, religious), and setting recurring dates. Functionality integrates with attendance and timetable modules to automatically adjust schedules, ensuring accurate tracking of academic days.
- **Allocate Class Teacher** (/academics/allocate-teacher): This submodule enables the assignment of teachers to specific classes and subjects. It supports creating teacher-class mappings, defining primary and secondary responsibilities, and managing workload distribution. Functionality includes conflict resolution for overlapping assignments and integration with timetable generation for seamless scheduling.
- **Promotion** (/academics/promotion): Focused on student advancement, this submodule handles the promotion process from one grade to the next. It includes evaluating student performance, setting promotion criteria, and generating promotion lists. Functionality covers bulk promotions, handling conditional advancements, and updating student records accordingly.
- **Depromotion** (/academics/depromotion): This submodule manages the reverse process of promotion, allowing for student demotion based on performance or other criteria. It includes defining demotion rules, processing individual or bulk demotions, and updating academic histories. Functionality ensures proper documentation and integration with reporting modules.
- **Inquiry Management** (/academics/inquiry-management): This submodule tracks and manages student inquiries from prospective parents or students. It includes logging inquiries, assigning follow-up tasks, and converting inquiries to admissions. Functionality supports categorization, status tracking, and integration with communication modules for automated responses.

4.5 Students

The Students module is dedicated to comprehensive student lifecycle management, providing administrators with tools to view, add, edit, and manage student records. It is accessible exclusively to admin roles, ensuring secure handling of sensitive student data. This module serves as the central repository for student information, integrating with other modules like attendance, fees, and academics for a holistic view.

- **Student Management:** This module offers a list view of all students with search and filter capabilities by class, section, or status. It includes bulk operations for imports/exports and detailed profiles. Forms for adding or editing students contain fields

such as student name, roll number, date of birth, gender, address, contact details, parent/guardian information, enrollment date, class/section assignment, medical details, and photo upload. Functionality supports enrollment tracking, transfer management, and integration with academic and financial records.

4.6 Attendance

The Attendance module focuses on tracking and managing daily student attendance, providing tools for marking, viewing, and reporting. It is accessible to admin and teacher roles, enabling both administrative oversight and classroom-level management. This module ensures accurate attendance records, which feed into reports, fee calculations, and academic assessments.

- **Attendance Management:** This module allows users to mark attendance for specific classes and dates. It includes a class selection dropdown, date picker, and a list of students with present/absent checkboxes or radio buttons. Additional fields may include notes for absences, late arrivals, and bulk marking options. Functionality supports real-time updates, historical views, notifications for low attendance, and integration with reports for analytics.

4.7 Homework

The Homework module manages the creation, assignment, and evaluation of homework tasks, fostering academic engagement. It is accessible to admin, teacher, and staff roles, allowing collaborative educational activities. This module supports structured homework workflows from assignment to grading.

- **Add Homework:** This submodule enables creating new homework assignments. Forms include fields such as title, description, subject, class/section, due date, attachments (files or links), and instructions. Functionality allows assigning to specific students or groups, setting reminders, and tracking submission status.
- **Homework Evaluation:** This submodule handles reviewing and grading submitted homework. It features a list of submissions with fields for marks, comments, and feedback. Functionality includes bulk grading, generating reports on completion rates, and notifying students of results.

4.8 Leave Management

The Leave Management module centralizes leave workflows for students, teachers, parents, and support staff. It is a single standalone module in the sidebar with no nested submodules. This means it appears as one top-level menu item, and the internal page handles the complete leave lifecycle from request to approval to history.

- **Leave Management:** This page enables users to submit, review, and manage leave applications. It includes forms and records for leave requests, approval tracking, and leave history. Fields in the leave form typically include applicant name, leave type, start date, end date, reason, class/section or department, contact details, and supporting

documents. Approval tracking contains fields for approver name, approval status, comments, decision date, and any follow-up notes. The module also offers leave history views that show past requests with status, duration, remarks, and attached evidence. Functionality supports role-based workflows so admins can approve any request, teachers can approve classroom leave, parents can request leave for their child, and staff can manage operational leave records.

4.9 Fees

The Fees module is a parent module with nested submodules. It is intended to manage the full fee lifecycle for the school, including fee setup, concessions, collections, and dues tracking. This module is visible only to admin users, and each submodule maps to a specific fee-related responsibility.

Fee Category

This submodule defines the different fee heads used by the school, such as tuition, transport, library, exam, and miscellaneous charges. Forms typically include fee category name, description, type, default amount, applicable classes or groups, and active/inactive status. It creates a reusable fee catalog that can be applied consistently across students.

Fee Allocation

This submodule assigns fee structures to classes, sections, or student groups. Forms usually include allocation name, target class/section, applicable fee categories, amounts for each fee head, effective period, and additional notes. It determines how fees are charged for specific student segments.

Fee Discount Category

This submodule manages discount rules and concession schemes. Typical fields include discount name, discount type (percentage or fixed amount), eligible fee categories, eligibility criteria, validity dates, maximum limit, and description. It enforces consistent discount application across the system.

Add Student Discount

This submodule applies discounts directly to individual student accounts. Forms include student selection, discount category, amount or percentage, reason, effective period, and approval notes. It allows admins to grant special concessions while tracking why each discount was issued.

Fee Collection

This submodule records actual fee payments and receipts. Fields normally include student selection, fee summary, amount due, amount paid, payment mode, receipt

details, payment date, fines or adjustments, and remarks. It is the main transaction interface where the student's fee status is updated.

Fee Dues

This submodule tracks outstanding fees and overdue balances. It typically provides filters for student, class, and date, and shows total due amount, due dates, fee head breakdown, reminder status, and follow-up notes. It helps administrators manage collections and identify pending payments.

4.10 Timetable

The Timetable module manages school scheduling and is used by admin, teacher, and staff roles. It organizes how academic time is structured and ensures that classes, subjects, and teacher availability are aligned.

Working Days

This submodule defines the school calendar structure, including which days are academic working days and which are holidays or breaks. Forms usually include day types, start/end times, and any special scheduling exceptions. It serves as the foundation for all timetable generation.

Sessions

This submodule divides the school day into sessions or periods, such as morning, afternoon, or custom lesson blocks. Typical fields include session name, duration, start/end time, and any special session rules. It enables flexible daily scheduling.

Class Timetable

This submodule creates and manages schedules for each class. It assigns subjects, teachers, and periods in a class-wise layout. Fields include class selection, subject allocation, teacher assignment, period timing, and room/resource details. It produces the official schedule that students and teachers follow.

Teacher Timetable

This submodule focuses on individual teacher schedules, showing what classes they teach and when. Forms or views include teacher selection, assigned classes, free periods, and workload summary. It helps avoid conflicts and makes it easy for teachers to see their daily teaching plan.

Teacher Availability

This submodule tracks when teachers are available or unavailable for scheduling. Typical information includes teacher availability windows, preferred times, leave or

unavailability periods, and special assignment constraints. It integrates with timetable creation to prevent clashes and improve scheduling accuracy

4.11 Exams

The Exams module is submodules. It manages the entire exam lifecycle from planning to attendance, scoring, and result publication. This module is visible to admin, teacher, and staff roles.

Exam Types

Defines the different exam categories used by the school, such as midterms, finals, and practical exams. Typical form fields include exam type name, description, grade scale, and status. This helps standardize exam classification across the system.

Exam Terms

Manages exam periods or terms within the academic year, including start/end dates and associated exam schedules. Fields usually include term name, year, duration, and notes. This submodule links exam sessions to the academic calendar.

Set Exam

Creates specific exams with details such as subject, class, exam date, duration, and instructions. Form fields often include exam title, schedule, location, and invigilator assignment. It provides the actual exam schedule for students and teachers.

View Exams

Provides a consolidated view of all created exams. It includes filters for class, subject, term, and status. This submodule helps users review planned exams, edit schedules, and verify exam details.

Exam Attendance

Tracks student attendance during exam days. Fields include exam selection, student list, present/absent status, and notes. This ensures exam participation is accurately recorded and linked to each exam event.

Exam Result

Handles entry and management of exam marks and grades. Typical fields include student selection, subject, marks obtained, grade, remarks, and result status. It supports processing raw scores into published results.

Publish Result

Controls the release of exam results to students and parents. Forms include publication date, visibility options, and notification preferences. This submodule is used to make results available in a secure, timely manner.

Class Results

Displays aggregated exam performance for a class or subject. It provides summaries like average marks, toppers, and class-level analytics. This allows educators to review broader performance trends.

Attendance History

Stores past exam attendance records for audit and review. It includes filtering by exam, class, and date. This helps track historical exam participation and identify recurring attendance issues.

4.12 Messaging

The Messaging module supports school-wide communication, announcements, and multimedia updates. This module is visible to admin, superadmin, teacher, and staff.

SMS Service

Enables sending SMS notifications or bulk text messages to students, parents, and staff. Fields usually include recipient groups, message content, scheduling options, and delivery status. It supports urgent alerts and routine communication.

Broadcast Hub

Provides a central interface for broadcasting messages across the school community. Typical controls include message title, body, audience selection, and scheduling. It is useful for notifications like circulars, system alerts, and reminders.

Announcements

Manages announcement posts that appear in the school portal. Fields include announcement title, description, date, and target audience. This submodule is used for general notices, event updates, and policy changes.

Gallery

Handles multimedia sharing such as photos and images from school events. Fields include image upload, caption, category, and visibility. It allows the school to publish visual updates and celebrate activities.

Events

Manages school events and calendar items. Forms typically include event name, date/time, description, location, and participants. This submodule helps share event details and invite relevant users.

4.13 Transport

The Transport module with nested submodules. It manages school transport operations, route planning, and student allocation. This module is visible to admin and staff.

Bus Registration

Registers buses and vehicles used by the school fleet. Fields include vehicle number, capacity, driver details, route assignment, and status. This submodule maintains transport asset records.

Bus Routes

Defines transport routes and their stops. Typical fields include route name, start/end points, stop sequence, and estimated times. It is used to plan and visualize bus journeys.

Bus Stops

Manages individual bus stops and pickup/drop points. Fields include stop name, location, sequence, and service area. This supports route creation and student boarding plans.

Bus Fare

Configures transport fees for routes or students. Fields usually include fare type, amount, route association, and payment frequency. This submodule helps calculate and manage transport charges.

Student Allocation

Assigns students to buses and routes. Fields include student details, route selection, pickup/drop stop, and allocation status. This ensures each student has a transport plan and helps monitor usage.

4.14 Parents

The Parents module is a parent-level module with a single nested submodule, and it is visible only to admin users. It is designed to manage guardian relationships and parent records in the school system.

Parent Management

This submodule handles the complete lifecycle of parent and guardian profiles. It connects parents to their children, stores contact information, and supports any administrative workflows that require parent details.

Typical functionality includes:

- Creating and editing parent/guardian profiles
- Capturing name, email, mobile number, relationship to student, and address
- Linking each parent to one or more students
- Managing login credentials or portal access for parents

- Recording additional contact details such as alternate phone, occupation, and workplace
- Tracking parent status and approval or verification information

4.14 Reports

The Reports module is visible only to admin users. It provides analytics and operational summaries across finance, attendance, exams, transport, and system performance. This module is designed to turn raw school data into actionable reports and help administrators monitor trends and make decisions

Overview

The Overview submodule delivers a consolidated executive-level snapshot of school performance. It aggregates key metrics from attendance, finance, exams, and operations into a single dashboard-style report. Typical content includes total students, teachers, attendance rate, fee collection progress, exam pass percentage, and recent alerts. This page often includes charts, trend lines, and quick status cards so administrators can immediately identify areas that need attention.

Consolidated Report

The Consolidated Report submodule combines multiple functional areas into a unified summary. It is designed for management review and board reporting. This report typically merges attendance trends, fee collection figures, exam performance, and operational summaries into one comprehensive view. It may allow selecting a date range, school division, or academic year, and output results in a printable or exportable format.

Finance Reports

The Finance Reports submodule focuses on financial health and revenue analytics. It typically shows fee collection totals, collection vs target comparisons, discount impact, and category-wise income. Users can filter by academic year, class, or fee type, and view charts showing cash flow or payment trends. This is useful for finance teams to validate collections and uncover areas of shortfall.

Attendance Reports

The Attendance Reports submodule analyzes student and staff presence across time. It usually provides attendance percentage breakdowns by class, section, day, and month. Administrators can view absence trends, late arrivals, and class-wise comparisons. It often includes filters for class, date range, and student group, helping schools identify chronic absenteeism or attendance issues.

Exam Reports

The Exam Reports submodule provides academic assessment analytics. It typically includes class average scores, subject-wise performance, pass/fail ratios, and top performer lists. It can also compare results across terms or exam types. This submodule helps educators understand exam effectiveness and identify subjects or groups needing intervention.

Transport Reports

The Transport Reports submodule assesses school transport usage and route performance. It usually contains route occupancy, student allocation summaries, and trip frequency data. Administrators can monitor which routes are most utilized, identify empty capacity, and review fare collection linked to transport services. This helps optimize fleet planning and route assignments.

Fee Collection Report

The Fee Collection Report submodule shows detailed payment collection activity. It focuses on the actual money received during a period, often including student name, invoice reference, amount paid, payment mode, and receipt status. It is designed for finance staff to verify collections and reconcile payments against expected dues.

Fee Collection List

The Fee Collection List submodule presents a transaction-style list of fee receipts and payments. It is tailored for reviewing individual entries rather than summary totals. Typical fields include student, fee category, collection date, payment status, and remarks. This list is useful for auditing and following up on payment records.

Student Detailed Report

The Student Detailed Report submodule provides a deep profile of a student's academic and financial data. It typically includes attendance history, exam results, fee payment status, and behavioral or activity notes. This report is useful when administrators need a complete view of a single student's performance and obligations.

Fee Transaction Report

The Fee Transaction Report submodule focuses on the underlying financial transactions behind fee activity. It includes payment entries, adjustments, fines, concessions, and refunds. Typical details include transaction date, transaction type, amount, student, and approval status. This report is valuable for audit trails and financial reconciliation.

Fee Category Report

The Fee Category Report submodule analyzes revenue by fee head. It typically breaks down collections into categories such as tuition, transport, library, exam, and miscellaneous. This lets administrators see which fee categories contribute most to total income and identify categories with low collection rates.

Fee Paid By Division

The Fee Paid By Division submodule shows payment performance across divisions or sections. It allows comparison of collection rates between different groups of students. Typical data includes total fees paid per division, outstanding balances, and percentage of students with completed payments. This helps identify areas with stronger or weaker fee compliance.

Fee Defaulters Report

The Fee Defaulters Report submodule lists students or accounts with unpaid or overdue fees. It often includes total outstanding amount, number of overdue days, and last payment date. This report is used to prioritize follow-up actions and send reminders to guardians or students with pending balances.

Total Fee Paid Report

The Total Fee Paid Report submodule summarizes all collected fees for a selected period. It shows the aggregate amount received, often broken down by class, division, or fee category. This is useful for financial reporting and cash flow review.

Total Fee Pending Report

The Total Fee Pending Report submodule summarizes all outstanding fee amounts. It highlights the total due value, often with segmentation by class, section, or fee type. This report helps administration understand the size of unpaid liabilities and the scope of collection effort needed.

Expense vs Income Report

The Expense vs Income Report submodule compares operational expenses against collected income. It may include expense categories, revenue sources, and net surplus/deficit. This report is key for financial planning, budget review, and understanding whether school operations are financially sustainable.

4.15 Sports Management

The Sports Management module is a parent module with nested submodules. It is visible only to admin users and handles all sports-related activities, events, and achievement tracking.

Overview

Provides a dashboard view of all sports programs, active teams, tournaments, and recent achievements. It typically displays enrollment statistics, upcoming events, and overall

sports participation metrics. This page helps administrators understand the scope and health of the school's sports program.

Sports Master

Manages the catalog of sports offered by the school. Form fields typically include sport name, description, type (individual/team), season, and equipment requirements. This submodule creates the foundational list of sports that students can participate in.

Teams

Handles team creation and management for different sports. Typical fields include team name, sport type, captain/coach assignment, member list, division or age group, and team status. This submodule tracks which students are part of which teams and who leads them.

Tournaments

Manages sports tournaments and competitions. Form fields usually include tournament name, sport, dates, participating teams, venue, rules, and results. This submodule organizes inter-school or intra-school competitions and tracks outcomes.

Achievements

Records and displays student and team accomplishments in sports. Typical fields include achievement type (medal, award, title), description, student/team name, date, and certificate details. This submodule celebrates success and maintains a history of achievements for records and recognition.

4.16 Hostel Management

The Hostel Management module is a parent module with nested submodules. It is visible to admin, student, warden, and staff roles and handles residential facilities and student accommodation.

Hostel Master

Sets up hostel properties and basic configuration. Form fields typically include hostel name, location, capacity, warden assignment, contact details, and facilities list. This submodule defines the physical hostel infrastructure and assigns administrative responsibilities.

Room Allocation

Manages room assignments for hostel students. Typical fields include room number, capacity, block/wing, assigned students, bedding status, and maintenance notes. This

submodule ensures every hostel student has assigned accommodation and tracks room occupancy.

Outpass

Manages student requests to leave the hostel temporarily. Form fields typically include student name, outpass dates, destination, purpose, parental approval status, and return confirmation. This submodule tracks when students are away and maintains security by logging all exits and returns.

4.17 Store Management

The Store Management module is a parent module with nested submodules. It is visible to admin and staff roles and handles school inventory, procurement, and point-of-sale operations.

Manage Unit

Defines units of measurement for inventory items. Form fields typically include unit name (kilograms, liters, pieces), abbreviation, and conversion factors. This submodule standardizes how inventory quantities are measured and tracked.

Manage Category

Creates item categories for organizing inventory. Typical fields include category name, description, parent category, and status. This submodule provides a taxonomy for grouping similar items together.

Manage Items

Maintains the master catalog of items available in the school store. Form fields usually include item name, SKU, category, unit of measurement, cost price, selling price, stock level, and supplier information. This submodule is the central database for all inventory items.

Manage Suppliers

Tracks vendor and supplier information. Typical fields include supplier name, contact person, phone, email, address, payment terms, and account details. This submodule maintains relationships with external suppliers and helps manage procurement.

Stock Purchase

Records incoming inventory from suppliers. Form fields typically include supplier selection, items purchased, quantities, unit cost, total cost, delivery date, and invoice reference. This submodule updates stock levels when purchases arrive.

Item Sale (POS)

Manages point-of-sale transactions for items sold to students or staff. Fields usually include item selection, quantity sold, selling price, payment mode, customer details, and receipt generation. This submodule handles cash transactions and stock deductions.

Consumption Report

Tracks how inventory is being used over time. This report typically shows items consumed (sold or used), quantities, dates, and trends. It helps administrators identify popular items and manage reordering.

4.19 Accounts

The Accounts module is a parent module with nested submodules. It is visible only to admin users and manages the school's financial accounting, ledger entries, and transaction records.

Chart of Accounts

Establishes the account structure used for all financial transactions. Form fields typically include account name, account code, account type (asset, liability, income, expense), description, opening balance, and parent account. This submodule creates the fundamental accounting framework that categorizes all school transactions.

Ledger Accounts

Manages detailed ledger records for each account. It displays transaction history, running balances, and account statements. Typical information includes account name, transaction date, debit/credit amounts, transaction reference, and balance. This submodule provides the detailed view of account activity over time.

Journal Voucher

Records journal entries that adjust accounts. Form fields usually include voucher date, transaction description, debit account, credit account, amount, reference, and approver. This submodule handles compound entries and non-standard transactions that don't fit standard transaction types.

Voucher Registry

Maintains a history of all vouchers and transactions entered. It typically displays voucher number, date, description, accounts involved, amounts, status, and approval history. This submodule serves as the audit trail for all financial entries and supports reconciliation.

4.20 HR and Payroll

The HR and Payroll module is a parent module with nested submodules. It is visible only to admin users and manages staff compensation, attendance, and payroll operations.

Session Management

Defines payroll periods or sessions for salary calculations. Form fields typically include session name, start date, end date, financial year, and status. This submodule establishes the time periods over which staff are paid.

Staff Attendance

Records daily attendance marking for teaching and support staff. Forms include staff name, attendance date, present/absent status, late arrival notes, and overtime hours. This submodule captures the attendance data needed for salary calculations and performance review.

Pay Heads

Defines salary components such as basic pay, allowances, deductions, and bonuses. Form fields usually include pay head name, type (earnings/deduction), calculation method, amount, and applicable staff categories. This submodule creates the building blocks of salary structures.

Payment Modes

Establishes methods through which staff are paid, such as bank transfer, cash, or check. Typical fields include mode name, description, processing time, and applicable rules. This submodule tracks how salary disbursement occurs.

Salary Settings

Configures salary structures for different staff grades or positions. Form fields typically include staff category, applicable pay heads, salary amount, deduction rules, and effective date. This submodule ties pay heads to staff roles and creates complete salary packages.

Advance Salary

Manages advance salary requests and processing. Forms include staff name, advance amount, purpose, repayment period, and approval status. This submodule tracks temporary salary advances and their recovery.

Salary Payment

Records actual salary disbursements to staff. Typical fields include staff name, payment session, gross salary, deductions, net pay, payment mode, payment date, and receipt status. This submodule finalizes payroll and produces payment records.

4.21 Library

The Library module is a parent module with nested submodules. It is visible to admin and staff roles and manages the school's library collection, borrowing, and literary resources.

Books Inventory

Maintains the catalog of all books in the library. Form fields typically include book title, author, ISBN, subject/category, publication year, publisher, total copies, available copies, and condition status. This submodule serves as the searchable book database.

Issue/Return

Manages the borrowing and returning of books by students and staff. Forms include member selection, book selection, issue date, due date, return date, fine calculations (if overdue), and remarks. This submodule tracks who has borrowed what and manages the circulation workflow.

Authors Master

Catalogs authors whose books are in the library. Form fields typically include author name, biography, nationality, specialization, and contact information. This submodule helps organize books by author and supports author-based searches.

Publishers Master

Maintains publisher information for books in the collection. Typical fields include publisher name, location, contact details, and website. This submodule tracks publisher relationships and helps in procurement planning.

Barcode Generator

Creates and prints barcodes for books to streamline issue/return processes. It typically generates barcodes based on ISBN or internal library ID, allowing quick scanning during borrowing and returning. This submodule reduces manual entry errors and speeds up library transactions.

These three modules complete the primary functional module documentation. The remaining module is System Administration (4.22) for superadmin role only, if you'd like to include it.
